

ABSTRACT

A weighted scrub brush has a brush head defining a leading end, a trailing end, a pair of laterally opposing ends, a downwardly facing bristle support surface, and an upwardly opening weight recess. A weight having first and
5 second opposing ends is removably positioned within the weight recess. Mating support members support the first end of the weight, while a cantilevered support latch partially overlaps the second end of the weight to secure the weight within the weight recess. A conduit extends from a liquid intake port, through the handle, and to the brush head to dispense liquid from the conduit to the plurality
10 of bristles. A roller is secured to a central body portion of the brush head forward of the handle, such that the brush head may be pivoted to a forward, inverted position to roll the brush.
